ODT Summative 2

Idea Brief :

IEQ² is a compact, autonomous robot designed to navigate complex mazes while interpreting environmental cues, specifically colored lights, as emotional states. Using sensors to detect light wavelengths, the robot maps these to a predefined emotion palette (e.g., red = anger/frustration), adapting its pathfinding strategy to "feel" and respond to the maze's "mood."

Basic Idea Sketch :

ESP32 x 2

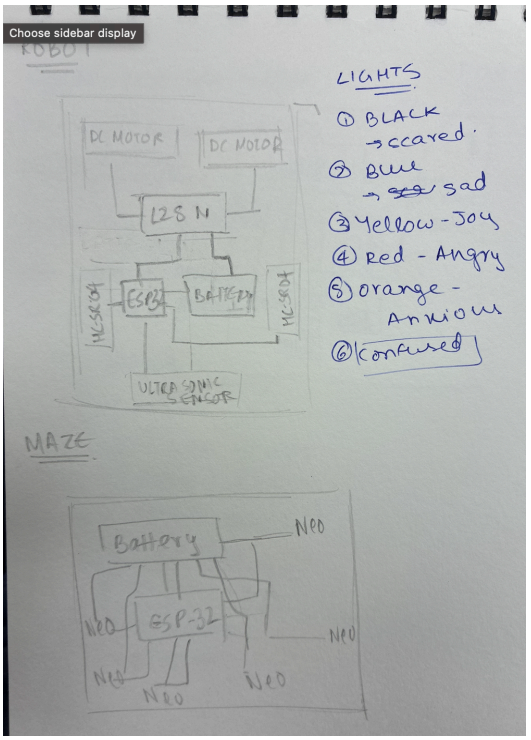
2 DC motor left right

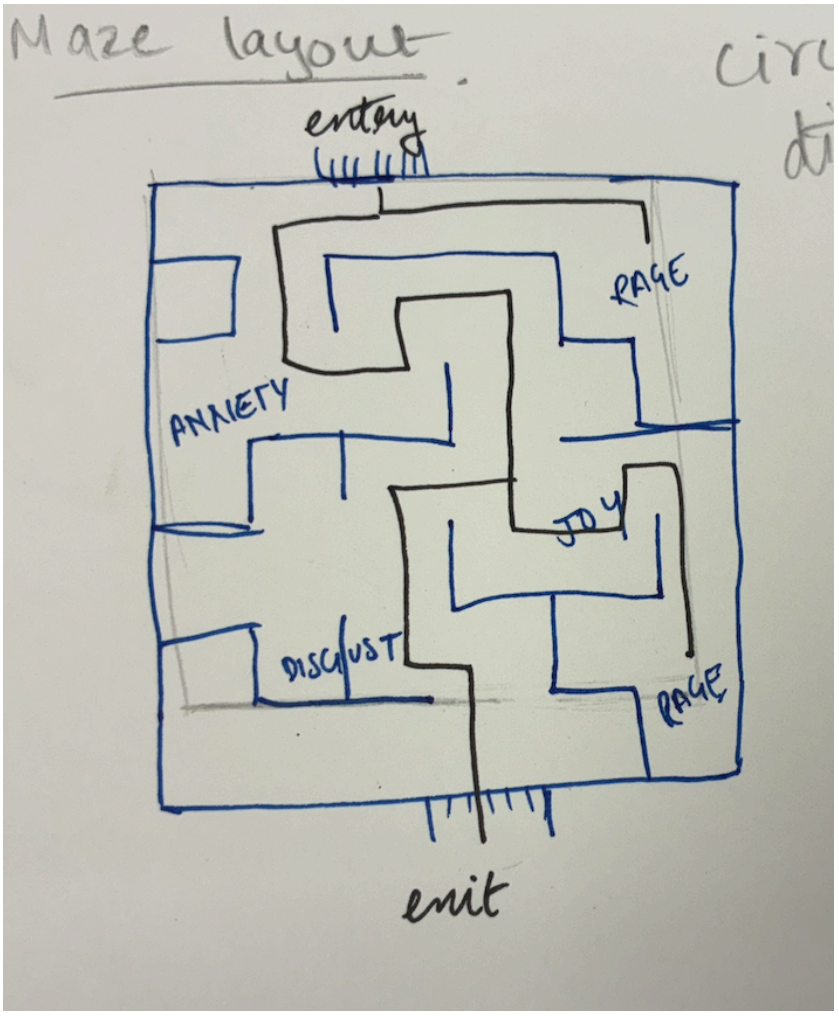
CHASSIS (wheels)

L298N (motor driver)

battery holder

3 (HC-SR04) US

2 x LCD / OLED x 2




TCS OS →
